The art of experiment

Who says the kids have to stop learning when they leave the classroom? With these cool new kits from The Young Scientists Club, your little lab rats won't even realize they're learning.

Bring earth science to your backyard with the minerals, crystals and fossils kit. Kids can grow a salt rock garden, make rock candy and break open a large geode. They'll identify unknown minerals with the streak, hardness, magnetic and acid tests, and even making a mold fossil.

Or, if you've got a budding storm chaser in the family, let him make his own weather station with a barometer, wind vane, rain gauge and thermometer.

Pick up a kit at Lakeshore Learning in Dallas for \$24.99. That volcano you made in middle school science class? See if you've still got the touch.
